Medical Therapy in Urology

Medical Therapy in Urology

The future of urology is changing from one based around surgery, to an outpatient system, concentrating mainly on medical management. Last year, in the UK, there were almost two million hospital consultations for urological symptoms and an estimated five million consultations in general practice. With such a significant proportion of care being delivered for urology, 80% of which can be managed medically, we felt that a resource should be made available to providers that will serve as a quick and useful guide to the medical management of urological disease. The aim was to provide a fresh, practical, and concise overview of the key medical management issues every practicing clinician faces in an outpatient urology setting, on a daily basis. With these goals in mind, each chapter starts with a brief overview of the relevant anatomy/physiology and pathology of the condition in question, and then goes on to give an explanation of the drugs used, including mode of action, doses, side effects, and important interactions/contraindications. Finally, there is a brief but relevant section on review of medical literature and a clinical section on when a particular drug treatment should be used. A list of key points can be found at the end of each section.
