Esophageal Carcinoma: State of the Art (Recent Results in Cancer Research)

The Symposium "Esophageal Carcinoma - State of the Art" has aroused very great interest. The numerous enquiries have caused us to publish the congress proceedings in the present volume. Particular attention was paid to current topical problems. One of the areas on which the present volume focuses is the epidemiology and pathology of esophageal adenocarcinoma. Compared to squamous epithelial carcinoma, this is increasing in incidence in Europe. Modern diagnostic methods are described such as laser induced fluorescence spectroscopy or the optical coherence endoscopic technique. The latter enables normal mucosa to be distinguished from dysplastic or malignant lesions, in contrast to conventional endoscopy. As in other tumors of the gastrointestinal tract, neoadjuvant therapy is becoming of increasing importance. Since the indication crucially depends on the tumor stage, two contributions deal with postoperative staging, with the diagnostic reliability of the individual techniques and new methods such as endoluminal MRI. There is no doubt that neoadjuvant chemotherapy is indicated in tumors which are irresectable and in tumor stages in which resectability is uncertain. However, to what extent it should also be applied in the resectable stage will be discussed in the individual contributions both for adenocarcinoma and for squamous epithelial carcinoma. In the meantime, surgical treatment of esophageal carcinoma has been largely standardized. Differences with regard to radicality are still found in the extent of lymphadenectomy, especially in inclusion of cervical lymph nodes.
